CAPGEMINI FRESHER HIRING — 2026

Detailed Round-by-Round Guide | AI Literacy, Technical MCQs, Debugging & AI-Assisted Coding

About Company

Capgemini SE is a French multinational information technology (IT) services and consulting company. It is headquartered in Paris, France.[3] The business was established as the Société pour la Gestion de l'Entreprise et le Traitement de l'Information (Sogeti) by Serge Kampf in 1974. It adopted the name CAP Gemini Sogeti in 1975, shortly after it acquired the Centre d'Analyse et de Programmation (CAP) and Gemini Computer Systems. The company expanded considerably during the early 1980s, often via the acquisition of other companies.

Core Services & Capabilities

- **Strategy & Transformation:** Management consulting, creative design, and digital innovation.
- **Applications & Technology:** Cloud, data, artificial intelligence (AI), cybersecurity, and custom software development.
- **Engineering & Operations:** Intelligent industry R&D, digital engineering, and business process outsourcing (BPO).

1. How many rounds are there in 2026?

For the newer campus pattern reported in early October 2026, candidates commonly describe one communication screening before the main assessment, then four assessment modules, followed by interview stage(s). Depending on how a college counts stages, this is often described as approximately 6–8 stages overall. It is not a fixed company-wide round count.

Order	Stage	What it checks	Elimination status
Before assessment	Communication / English screening	Spoken/written communication or language ability, depending on the drive	Can be a screening gate; confirm in your invite
1	AI Literacy + Technical MCQ assessment	AI concepts and technical/programming fundamentals	Reported as the main early elimination round
2	Debugging assessment	Find and fix errors in code; test logic and output	May influence progression/shortlisting; exact rule is drive-specific
3	AI-assisted coding / feature development	Use an AI-enabled coding environment or prompts to implement/complete a task	May be evaluated for correctness and approach; exact cutoff not publicly universal
4	Cognitive / game-based assessment	Attention, patterns, reasoning, speed/accuracy or other cognitive skills	Role/drive-specific; do not assume it is always non-elimination
5	Technical interview	Programming, CS fundamentals, project ownership and problem-solving	A successful technical evaluation is required before formal HR interview in the published general process
6	HR / behavioural interview	Communication, motivation, teamwork, role	Selection stage

		fit, location/availability and employment details	
After selection	Document validation, compensation, offer and onboarding	Record validation, offer acceptance and background verification	Not an assessment round, but offer is subject to checks

2. AI Literacy + Technical MCQ round — highest priority

A candidate report dated 5 October 2026 describes 40 questions: 20 AI Literacy + 20 Technical, with this combined assessment acting as an elimination round. The report says questions were scenario/paragraph-based and answer choices could be very similar. Treat the 40-question split as a recent reported pattern, not an official guarantee; your assessment email may specify a different count, timing, or structure.

2.1 AI Literacy: topics to study

- AI vs. machine learning vs. deep learning; traditional software vs. AI systems.
- Generative AI and large language models (LLMs): what they do and common limitations.
- Prompt engineering: clear instructions, context, constraints, examples, output format, and iterative refinement.
- Hallucinations: plausible-sounding but incorrect or fabricated outputs; verify facts against reliable sources.
- Responsible AI: fairness, bias, transparency, explainability, accountability, privacy, security, and human oversight.
- Data quality and representativeness; how biased or incomplete data can affect outcomes.
- Confidentiality: do not paste customer data, source code, credentials, personal data, or company secrets into unapproved AI tools.
- Copyright and intellectual property: check ownership, licensing, and organisational policies before reusing AI-generated content.
- AI output verification: test code, check calculations, validate sources, inspect edge cases, and never trust output blindly.
- Human-in-the-loop workflows: use AI to assist, but have a person review high-impact decisions.
- Automation vs. augmentation; appropriate and inappropriate use cases for AI.
- Security risks: prompt injection, data leakage, malicious inputs, and over-reliance on model responses.

2.2 How to answer scenario-based AI Literacy questions

- Choose the response that protects confidential information and follows approved company policy.
- Verify generated facts, code, and references before using them in production or making decisions.
- Identify possible bias or unfair outcomes and escalate/mitigate rather than ignoring them.
- Use human review for consequential decisions; AI should not be treated as automatically correct.
- Give the AI a clear task and relevant non-sensitive context; refine the prompt if the response is weak.
- Do not upload proprietary or personal information into public tools without explicit authorisation.

2.3 Technical MCQ: topics to revise

- Programming fundamentals: variables, types, operators, conditions, loops, functions, arrays, strings and recursion basics.
- Output prediction and pseudocode tracing; carefully track loop iterations, indexes, integer division, and operator precedence.
- Object-oriented programming: encapsulation, abstraction, inheritance, polymorphism, classes and objects.
- Data structures: arrays, strings, stacks, queues, linked lists, hash maps/sets, searching and sorting basics.
- Algorithms and complexity: linear/binary search, common sorting concepts, and Big-O time complexity.
- Database basics: primary/foreign keys, normalization concepts, SELECT, WHERE, GROUP BY, JOIN, aggregate functions.
- Software engineering: SDLC, debugging, testing, version control, APIs and basic error handling.
- Language fundamentals in the language selected/allowed by your drive (e.g., C, C++, Java or Python).

3. Debugging round

Goal: identify why a program fails, correct the smallest necessary issue, and ensure the program passes the expected test cases. Reported assessment environments and languages can vary; follow the language options stated by your college or test platform.

Practice these bug types

- Syntax errors: missing brackets, semicolons, incorrect indentation or misspelled keywords.
- Logic errors: wrong condition, incorrect formula, wrong loop boundary, or incorrect update statement.
- Array/string errors: off-by-one indexes, empty input, duplicates, case sensitivity and boundary conditions.
- Control-flow errors: loop never ends, branch not reached, misplaced break/continue, or incorrect return.
- Data-type issues: integer division, overflow, type conversion, null/None handling, and comparing values incorrectly.
- Algorithmic errors: wrong initial values, mishandled duplicates, incorrect sorting/search logic, or incomplete edge-case handling.

Suggested method: read the problem → run/trace the code → identify the failing line or assumption → make a minimal fix → test normal, boundary, and unusual inputs.

4. AI-assisted coding / feature-development round

Recent candidate accounts describe an AI-assisted coding task. The exact tool, prompt interface, permitted actions, language, task difficulty and scoring criteria are not publicly fixed for every drive. The key preparation skill is to use AI as an assistant while remaining responsible for the code.

- Break the requirement into small, testable functions before asking for code.
- Write prompts that specify language, input/output, constraints, edge cases and expected behaviour.
- Read and understand generated code; do not submit code you cannot explain.
- Compile/run the code and test it. AI-generated code can contain syntax, logic, security or performance errors.
- Check edge cases: empty input, one item, duplicates, large values, invalid input and boundary indexes.
- Keep the implementation aligned with the requested requirements; avoid unrelated changes.
- If AI output is incorrect, provide the failing test/error and ask for a targeted correction rather than blindly regenerating everything.

5. Cognitive / game-based assessment

This module may test attention, pattern recognition, working memory, response speed, accuracy, or rule-following. The exact games and scoring vary. Read every instruction and practise accuracy first; do not assume that speed alone guarantees a good result.

- Do a few short pattern/sequence and attention exercises before the assessment.
- Keep a steady pace and follow the on-screen rules.
- Use only the permitted device and environment.
- Do not assume this round is always qualifying-only or always elimination; ask the placement cell if the policy matters.

6. Communication / English screening

Some campus drives report a communication round before the technical assessment. It may assess spoken fluency, listening, grammar, clarity, pronunciation or structured responses. Not every drive uses the same communication test.

- Practise a 60–90 second self-introduction.
- Explain one project in simple English: problem, your contribution, technology, challenge and result.
- Answer the question directly before adding details.
- Speak clearly and naturally; avoid memorised answers that do not address the prompt.

7. Which rounds are elimination rounds?

Best evidence-based answer: the combined AI Literacy + Technical MCQ is explicitly described as an elimination round in recent candidate reports. For debugging, AI-assisted coding and cognitive assessment, candidate experiences differ and public reports do not establish one universal rule for all drives. Treat every scheduled assessment as important. A module can affect the shortlist or final role mapping even if candidates online say it was not a separate elimination gate.

Capgemini's official public recruitment page does not publish a universal round-by-round elimination matrix, exact cutoff, negative-marking rule, or pass percentage. Do not rely on claims such as 'only one round eliminates' or 'every round eliminates' unless your specific campus/drive instructions confirm it.

8. Interview rounds

Technical interview (often one or two, depending on role)

- Be ready to explain your strongest programming language and write/trace small programs.
- Revise OOP, DBMS/SQL, data structures, debugging and fundamentals listed in the job description.
- Explain your project end-to-end and clearly state what you personally built.
- Practise strings, arrays, palindrome/reversal, frequency counting, searching/sorting and basic complexity.
- If you do not know an answer, explain your reasoning honestly rather than bluffing.

HR / behavioural interview

- Tell me about yourself.
- Why Capgemini and why this role?
- Explain your final-year or strongest project.
- Describe a challenge, mistake or disagreement and how you handled it.
- What are your strengths and what are you improving?
- Are you comfortable with the role's location, training, work arrangement and conditions stated in the offer/job description?

Capgemini's official overview says one or two technical interviews may be held depending on position and that the formal HR behavioural interview follows successful technical evaluation. A drive may add or reorder steps.

9. A focused 10-day preparation plan

Day	Preparation
Day 1	Read the campus notice and invitation; confirm the exact modules, platform, language options and timing.
Day 2	AI fundamentals: AI/ML/GenAI/LLMs, limitations, hallucinations and verification.
Day 3	Responsible AI: privacy, bias, fairness, security, copyright, human oversight and scenario questions.
Day 4	Programming basics, output tracing, pseudocode, loops, arrays and strings.
Day 5	OOP, data structures, searching/sorting and Big-O basics.
Day 6	DBMS/SQL, SDLC, testing and API/software fundamentals.
Day 7	Debugging practice: syntax, logic, edge cases and boundary conditions.
Day 8	AI-assisted coding practice: prompt, review, run, test, fix and explain.
Day 9	Cognitive/English practice; self-introduction and project explanation.
Day 10	Full mock, revise mistakes, prepare ID and logistics, sleep adequately.

10. Documents and assessment-day checklist

- College placement notice and assessment invitation, with application/candidate ID.
- College ID and a government photo ID as required by the instructions.
- Updated resume and academic details, if requested.
- Laptop/desktop, browser, webcam, microphone and stable internet only as permitted by the test organiser.
- Arrive early for campus tests; follow the lab/device instructions and do not switch devices without permission.
- Read proctoring rules. Do not use unauthorised websites, AI tools, phones, screenshots or outside help during a restricted assessment.
- After selection, submit genuine documents through the official candidate portal and complete requested verification.

11. Offer, background verification and recruitment safety

The general official process includes documentation, compensation discussion, formal offer, offer acceptance, background verification and onboarding. The timeline varies by role and business needs.

Capgemini states it does not charge candidates recruitment fees. Be suspicious of requests for money, passwords, OTPs or bank/UPI details. The official India recruitment page says interview communication is handled through its official ATS/CRM system and virtual interview invitations use Microsoft Teams. Verify suspicious messages through official channels.

Final advice

Prepare the AI Literacy + Technical MCQ round first because recent October 2026 candidate reports identify it as an early elimination gate. Then practise debugging and AI-assisted coding thoroughly, and do not ignore cognitive or communication modules. However, use your own campus drive notice as the source of truth for round count, duration, cutoffs, language options and elimination rules.
